

JavaScript – JSON | AJAX

Exercise

In jQuery/JS , create the following app to load a file with AJAX.

Requirements

- Folder data: avengers.json -> Load the names into the select box
- When no avenger is selected (“-“) the button should be disabled (change event)
- When an avenger is selected (e.g. Thor) and you click on the button then the picture of Thor should be seen in the card element. You can use the selected name to build the image path or set an session storage where you save the loaded avengers and look for the correct avenger.

Extension:

- You can extend the JSON-File with more attributes (like force, or movie appearances) and show these details in the card element
